SPACE EXAMPLE FOR INSTALLATION

Notes :

1. Heights of walls

Front : 1500mm

Suction side : 500mm

Side : Height unrestricted

The installation space shown in this figure is based on the condition of cooling operation at the outdoor air temperature of 35°C.

The installation space of suction side shown above must be expanded in the following case.

• Design outdoor temperature becomes over 35°C.

• Operating over Max. operating load

(In case of causing a heavy heating load at indoor unit side)

2. If the above wall heights are exceeded then h/2 and h/2 should be added to the front and suction side service spaces respectively as shown in the following figure.

3. When installing the units the most appropriate pattern should be selected from those shown above in order to obtain the best fit in the space available always bearing in mind the need to leave enough room for a person to pass between units and wall and for the air to circulate freely.

(If more units are to be installed than are catered for in the above patterns your layout should take account of the possibility of short circuits.)

4. The units should be installed to leave sufficient space at the front for the on site refrigerant piping work to be carried out comfortably.

1. Rate of change in cooling capacity

2. Rate of change in heating capacity

[Diameter of the main pipes(standard size)]

Model	gas	liquid
ROY140PY1	φ 15.9	φ 9.5

[Explanation of symbols]

HP : Level difference between indoor and outdoor units where indoor unit is inferior position
HW : Level difference between indoor and outdoor units where indoor unit is superior position
L : Equivalent pipe length(m)
α : Rate of change in cooling / heating Capacity

[Notes]

- These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions. Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
- Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.
Calculating A/C capacity of outdoor units
• Condition: Indoor unit combination ratio does not exceed 100%.
Maximum A/C capacity of outdoor units = $\frac{A/C \text{ capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{X \text{ Capacity change rate due to piping length to the farthest indoor unit}}$
• Condition: Indoor unit combination ratio exceeds 100%
Maximum A/C capacity of outdoor units = $\frac{A/C \text{ capacity of outdoor units obtained from capacity characteristic table at the combination}}{X \text{ Capacity change rate due to piping length to the farthest indoor unit}}$

- When overall equivalent pipe length is 90m or more, the diameter of the main gas pipes (outdoor unit-branch sections) must be increased.
[Diameter of above case]

Model	gas	liquid
ROY140PY1	φ 19.1	Not Increased

- Read cooling / heating capacity rate of change in the above figures based on the following equivalent length.

Overall equivalent length=

(Equivalent length to main pipe) × Correction factor + (Equivalent length after branching)

Choose a correction factor from the following table.
[When cooling capacity is calculated: gas pipe size
[When heating capacity is calculated: liquid pipe size

Rate of change (object piping)	Correction factor
Cooling (gas pipe)	Standard size
Heating (liquid pipe)	Size increase
	1.0
	0.5

(Example)

In the above case

(Cooling) Overall equivalent length=80m×0.5+40m=80m
(Heating) Overall equivalent length=80m×1.0+40m=120m

The rate of change in cooling capacity when Hp=0m is thus approximately 0.78
heating capacity when Hp=0m is thus approximately 1.0

1. Rate of change in cooling capacity

2. Rate of change in heating capacity

[Diameter of the main pipes(standard size)]

Model	gas	liquid
RQYQ180PYI	φ19.1	φ9.5
RQYQ360PYI	φ25.4	φ12.7
RQYQ500PYI	φ28.6	φ15.9

[Explanation of symbols]

Hp : Level difference(m)between indoor and outdoor units
where indoor unit in inferior position
Hw : Level difference(m)between indoor and outdoor units
where indoor unit in superior position
L : Equivalent pipe length(m)
α : Rete of change in cooling / heating Capacity

[Notes]

- These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum)under standard conditions, Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
- Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.
Calculating A/C capacity of outdoor units
• Condition: Indoor unit combination ratio does not exceed 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the 100% combination

• Condition: Indoor unit combination ratio exceeds 100%
x Capacity change rate due to piping length to the farthest indoor unit

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the combination

x Capacity change rate due to piping length to the farthest indoor unit

- When overall equivalent pipe length is 90m or more, the diameter of the main gas and liquid pipes (outdoor unit-branch sections) must be increased.

[Diameter of above case]

Model	gas	liquid
RQYQ180PYI	φ22.2	Not Increased
RQYQ360PYI	φ28.6	φ15.9
RQYQ500PYI	φ31.8	φ19.1

1. Rate of change in cooling capacity

2. Rate of change in heating capacity

[Notes]

1. These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions.
Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.

2. Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.

Calculating A/C capacity of outdoor units
*Condition: Indoor unit combination ratio does not exceed 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the 100% combination

x Capacity change rate due to piping length to the farthest indoor unit
*Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the combination
x Capacity change rate due to piping length to the farthest indoor unit

x Capacity change rate due to piping length to the farthest indoor unit

3. When overall equivalent pipe length is 90m or more, the diameter of the main gas and liquid pipes (outdoor unit-branch sections) must be increased.

[Diameter of above case]

Model	gas	liquid
RQCVQ460PY1	φ34.9	φ15.9

[Diameter of the main pipes (standard size)]

Model	gas	liquid
RQCVQ460PY1	φ28.6	φ12.7

[Explanation of symbols]

HP: Level difference (m) between indoor and outdoor units where indoor unit is in inferior position

HM: Level difference (m) between indoor and outdoor units where indoor unit is in superior position

L: Equivalent pipe length (m)

α: Rate of change in cooling / heating Capacity

4. Read cooling / heating capacity rate of change in the above figures based on the following equivalent length.

Overall equivalent length =

(Equivalent length to main pipe) × Correction factor + (Equivalent length after branching)

Choose a correction factor from the following table.

[When cooling capacity is calculated: gas pipe size]

[When heating capacity is calculated: liquid pipe size]

Rate of change (Object piping)	Correction factor
Cooling (gas pipe)	Standard size
Heating (liquid pipe)	Size increase
	1.0
	0.5
	0.3

(Example) Equivalent length

In the above case

(Cooling) Overall equivalent length = 80m × 0.5 + 40m = 80m

(Heating) Overall equivalent length = 80m × 0.3 + 40m = 64m

The rate of change in cooling capacity when $H_P=0m$ is thus approximately 0.88
heating capacity when $H_P=0m$ is thus approximately 1.00

1. Rate of change in cooling capacity

2. Rate of change in heating capacity

[Diameter of the main pipes(standard size)]

Model	gas	liquid
RQCYQ540PY1	φ28.6	φ15.9

[Explanation of symbols]

HP : Level difference(m)between indoor and outdoor units
where indoor unit in inferior position

HM : Level difference(m)between indoor and outdoor units
where indoor unit in superior position

L : Equivalent pipe length(m)

α : Rate of change in cooling / heating Capacity

[Notes]

1. These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum)under standard conditions.

Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.

2. Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.

Calculating A/C capacity of outdoor units

• Condition: Indoor unit combination ratio does not exceed 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the 100% combination

x [Capacity change rate due to piping length to the farthest indoor unit]

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the combination

x [Capacity change rate due to piping length to the farthest indoor unit]

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the combination

x [Capacity change rate due to piping length to the farthest indoor unit]

3. When overall equivalent pipe length is 90m or more, the diameter of the main gas and liquid pipes (outdoor unit-branch sections) must be increased.

[Diameter of above case]

Model	gas	liquid
RQCYQ540PY1	φ34.9	φ19.1

4. Read cooling / heating capacity rate of change in the above figures based on the following equivalent length.

Overall equivalent length=

(Equivalent length to main pipe) × Correction factor + (Equivalent length after branching)

Choose a correction factor from the following table.

When cooling capacity is calculated: gas pipe size

When heating capacity is calculated: liquid pipe size

Rate of change (object piping)	Correction factor
Cooling (gas pipe)	1.0
Heating (liquid pipe)	0.5
	0.4

(Example)

In the above case

(Cooling) Overall equivalent length = 80m × 0.5 + 40m = 80m

(Heating) Overall equivalent length = 80m × 0.4 + 40m = 64m

The rate of change in cooling capacity when Hp=0m is thus approximately 0.87
heating capacity when Hp=0m is thus approximately 1.00

1. Rate of change in cooling capacity

[Notes]

- These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions. Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
- Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.
Calculating A/C capacity of outdoor units
• Condition: Indoor unit combination ratio does not exceed 100%.

$$\text{Maximum A/C capacity of outdoor units} = \frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{X Capacity change rate due to piping length to the farthest indoor unit}}$$

• Condition: Indoor unit combination ratio exceeds 100%.

$$\text{Maximum A/C capacity of outdoor units} = \frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the combination}}{\text{X Capacity change rate due to piping length to the farthest indoor unit}}$$

- When overall equivalent pipe length is 90m or more, the diameter of the main liquid pipes (outdoor unit-branch sections) must be increased.

[Diameter of above case]

Model	liquid
RCCEQ280PY1	φ12.7

2. Rate of change in heating capacity

- When the main sections of the interunit liquid pipe diameters are increased the overall equivalent length should be calculated as follows. (Heating only)
Overall equivalent length = (Equivalent length to main pipe) × 0.2 + (Equivalent length after branching)

- In the above case (Heating)
Overall equivalent length = $80\text{m} \times 0.2 + 40\text{m} = 56\text{m}$
The correction factor in capacity when $H_p = 0\text{m}$ is thus approximately 1.0.
5. In the combination which does not include cooling only indoor unit.
Calculate the equivalent length pipe by the following when you calculate cooling capacity.
Overall equivalent length = (Equivalent length to main pipe) × 0.5 + (Equivalent length after branching)

- In the above case (Cooling)
Overall equivalent length = $80\text{m} \times 0.5 + 40\text{m} = 80\text{m}$
The correction factor in capacity when $H_p = 0\text{m}$ is thus approximately 0.88.

[Diameter of pipe (Standard size)]

Model	liquid
RCCEQ280PY1	φ9.5

[Explanation of symbols]

- H_p : Level difference (m) between indoor and outdoor units where indoor unit in inferior position
 H_m : Level difference (m) between indoor and outdoor units where indoor unit in superior position
 L : Equivalent pipe length (m)
 α : Capacity correction factor

2. Rate of change in heating capacity

Model	liquid

2. Method of calculating A/C (cooling/heating) capacity:

The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.

Calculating A/C capacity of outdoor units

• Condition: Indoor unit combination ratio does not exceed 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

• Condition: Indoor unit combination ratio exceeds 100%.

Maximum A/C capacity of outdoor units = $\frac{\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination}}{\text{Indoor unit combination ratio}}$

4. When the main sections of the interunit liquid pipe diameters are increased the overall equivalent length should be calculated as follows, (Heating only)

Overall equivalent length = (Equivalent length to main pipe) × 0.3 + (Equivalent length after branching)

In the above case (Heating)
Overall equivalent length = 8.0m × 0.3 + 4.0m = 6.4m

The correction factor in capacity when H_p = 0m is thus approximately 1.0.

5. In the combination which does not include cooling only indoor unit, calculate the equivalent length pipe by the following when you calculate cooling capacity.

Overall equivalent length = (Equivalent length to main pipe) × 0.5 + (Equivalent length after branching)

In the above case (Cooling)
Overall equivalent length = 8.0m × 0.5 + 4.0m = 8.0m

The correction factor in capacity when H_p = 0m is thus approximately 0.93.
